# Chapter 1

## Usage

### 1.1 Installation

Download und unpack the file

<http://www.math.u-szeged.hu/~nagyg/OnAlgClosure-0.1.tar.gz>

into your pkg directory. You can load the package with the command

```
LoadPackage("OnAlgClosure");
```

### 1.2 Functions for AC-Frobenius automorphism actions

#### 1.2.1 AC\_FrobeniusAutomorphism

▷ AC\_FrobeniusAutomorphism( $q$ ) (function)

**Returns:** an AC-Frobenius automorphism

Creates the Frobenius map  $x \mapsto x^q$  for the prime power  $q$  which operates on objects of characteristic  $p$ : vectors, matrices (also in CVEC representation), polynomials and rational functions. The argument may be the finite field  $\text{GF}(q)$  as well.

Although algebraic closure is not defined in **GAP** one can say that AC-Frobenius automorphisms act on the algebraic closure of the prime field  $\text{GF}(p)$ .

An AC-Frobenius automorphism has infinite order. By default, no inverse of an AC-Frobenius automorphism is defined. AC-Frobenius automorphisms are not mapping as **GAP** objects.

These are the main differences to the **GAP** command `FrobeniusAutomorphism`.

It must be easy to install methods for the action of an AC-Frobenius automorphism on new classes of objects.

Example

```
gap> fr:=AC_FrobeniusAutomorphism(9);
AC_FrobeniusAutomorphism(3^2)
gap> Z(3)^fr;
Z(3)
gap> Z(27)^fr;
Z(3^3)^9
gap> v:=Random(GF(27)^5);
[ Z(3)^0, Z(3^3)^23, Z(3^3)^23, Z(3^3)^17, Z(3)^0 ]
gap> v^fr;
[ Z(3)^0, Z(3^3)^25, Z(3^3)^25, Z(3^3)^23, Z(3)^0 ]
gap> cv:=CVec(v);
```

```

<cvec over GF(3,3) of length 5>
gap> cv^fr;
<cvec over GF(3,3) of length 5>
gap> cv^fr=v^fr;
true

```

Example

```

gap> fr:=AC_FrobeniusAutomorphism(7^2);
AC_FrobeniusAutomorphism(7^2)
gap> x:=Indeterminate(GF(7),"x");
gap> pol:=(x^3-Z(7))/(x^2-Z(7^3));
(x^3+Z(7)^4)/(x^2+Z(7^3)^172)
gap> pol^fr;
(x^3+Z(7)^4)/(x^2+Z(7^3)^220)
gap> pol=pol^(fr^3);
true

```

AC-Frobenius automorphisms of the same characteristic can be multiplied and share a unique multiplicative identity.

Example

```

gap> fr:=AC_FrobeniusAutomorphism(9);
AC_FrobeniusAutomorphism(3^2)
gap> fr^2;
AC_FrobeniusAutomorphism(3^4)
gap> One(fr);
AC_FrobeniusAutomorphism(3^0)
gap> AC_FrobeniusAutomorphism(8)*AC_FrobeniusAutomorphism(16);
AC_FrobeniusAutomorphism(2^7)
gap> One(last)=One(fr);
false

```

## 1.2.2 AC\_FrobeniusAutomorphismOrbit

▷ AC\_FrobeniusAutomorphismOrbit(fr, obj) (function)

**Returns:** the Frobenius orbit of the given object as list  
 The (i+1)th element of the Frobenius orbit is  $obj(fr^i)$ .

Example

```

gap> fr:=AC_FrobeniusAutomorphism(7^2);
AC_FrobeniusAutomorphism(7^2)
gap> m:=[[0*Z(7),Z(7^3)],[Z(7^4)^-1,Z(7)^0]];
[ [ 0*Z(7), Z(7^3) ], [ Z(7^4)^2399, Z(7)^0 ] ]
gap> AC_FrobeniusAutomorphismOrbit(fr,m);
[ [ [ 0*Z(7), Z(7^3) ], [ Z(7^4)^2399, Z(7)^0 ] ], [ [ 0*Z(7), Z(7^3)^49 ], [ Z(7^4)^2351, Z(7)^0 ] ],
  [ [ 0*Z(7), Z(7^3)^7 ], [ Z(7^4)^2399, Z(7)^0 ] ], [ [ 0*Z(7), Z(7^3) ], [ Z(7^4)^2351, Z(7)^0 ] ],
  [ [ 0*Z(7), Z(7^3)^49 ], [ Z(7^4)^2399, Z(7)^0 ] ], [ [ 0*Z(7), Z(7^3)^7 ], [ Z(7^4)^2351, Z(7)^0 ] ] ]

```

An AC-Frobenius automorphism has infinite order. By default, no inverse of an AC-Frobenius automorphism is defined. AC-Frobenius automorphisms are not mapping as GAP objects. If you want, they act on the algebraic closure of the prime field  $\text{GF}(p)$ . In fact, these are the main differences to the GAP command FrobeniusAutomorphism.

It must be easy to install methods for the action of an AC-Frobenius automorphism on new classes of objects.

## 1.3 Functions for AC-projective linear transformations

### 1.3.1 AC\_ProjectiveLinearTransformation

▷ `AC_ProjectiveLinearTransformation( $M$ )` (function)

**Returns:** an AC-projective linear transformation

Creates the projective linear transformation  $\varphi$  corresponding to the  $n \times n$  matrix  $M$ . Here,  $M$  is a nonsingular matrix over the finite field  $\text{GF}(q)$ . By definition  $\varphi$  acts via `OnLines` on row vectors of length  $n$  with entries from the algebraic closure of  $\text{GF}(q)$ .

Example

```
gap> m1:=[[ Z(5^2), 0*Z(5), 0*Z(5) ],[ 0*Z(5), Z(5)^0, 0*Z(5) ],[ 0*Z(5), 0*Z(5), Z(5^2)^19 ]];;
gap> m2:=[[ Z(5^2)^13, Z(5)^2, Z(5)^0 ],[ Z(5)^2, Z(5)^2, 0*Z(5) ],[ Z(5)^0, 0*Z(5), 0*Z(5) ]];;
gap> t1:=AC_ProjectiveLinearTransformation(m1);
AC_ProjectiveLinearTransformation([ [ Z(5)^0, 0*Z(5), 0*Z(5) ], [ 0*Z(5), Z(5^2)^23, 0*Z(5) ], [
gap> t2:=AC_ProjectiveLinearTransformation(m2);
AC_ProjectiveLinearTransformation([ [ Z(5)^0, Z(5^2)^23, Z(5^2)^11 ], [ Z(5^2)^23, Z(5^2)^23, 0*
[ Z(5^2)^11, 0*Z(5), 0*Z(5) ] ])
gap> Order(t1);
24
gap> t1*t2;
AC_ProjectiveLinearTransformation([ [ Z(5)^0, Z(5^2)^23, Z(5^2)^11 ], [ Z(5^2)^22, Z(5^2)^22, 0*
[ Z(5^2)^5, 0*Z(5), 0*Z(5) ] ])
gap> t1/t2;
AC_ProjectiveLinearTransformation([ [ 0*Z(5), 0*Z(5), Z(5)^0 ], [ 0*Z(5), Z(5^2)^11, Z(5^2)^11 ]
gap> One(t1);
AC_ProjectiveLinearTransformation([ [ Z(5)^0, 0*Z(5), 0*Z(5) ], [ 0*Z(5), Z(5)^0, 0*Z(5) ], [ 0*
gap> Characteristic(t1);
5
```

AC-projective linear transformations of the same characteristic and dimension can be multiplied, possess an inverse AC-projective linear transformation and share a unique multiplicative identity.

AC-projective linear transformations defined over  $\text{GF}(q)$  have a regular permutation action on  $PG(n-1, q)$ . Via nice monomorphism,  $\varphi$  knows this permutation. This enables efficient arithmetics for groups generated by AC-projective linear transformations.

It must be easy to implement other actions of AC-projective linear transformations on GAP objects.

Example

```
gap> q:=5;
5
gap> mg:=GU(3,q);
GU(3,5)
gap> Size(mg);
2268000
gap> oset:=Orbit(mg,Z(q)^0*[0,0,1],OnLines);;
gap> Size(oset); q^3+1;
126
126
gap> pg:=AC_ProjectiveTransformationGroupWithShortOrbit(mg,oset);
<group with 2 generators>
gap> Size(pg); Size(PGU(3,q));
378000
```

```

378000
gap> vec:=Z(q)*[1,Z(q^3),0];
[ Z(5), Z(5^3)^32, 0*Z(5) ]
gap> OrbitLength(pg,NormedRowVector(vec));
75600
gap> StructureDescription(pg);
"PSU(3,5) : C3"

```

### 1.3.2 AC\_ProjectiveTransformationGroupWithShortOrbit

▷ AC\_ProjectiveTransformationGroupWithShortOrbit(*matgr*, *orb*) (function)

**Returns:** a projective linear cycle

Creates the AC-projective linear transformation group  $G$  corresponding to the matrix group *matgr*. *matgr* must have a faithful action on the orbit *orb*. This permutation action is stored as nice monomorphism of  $G$ .
